From Gerald H Pollack : Phase Transitions in Cell Biology g 2 phase or gap 2 phase is the second subphase of interphase in the cell cycle directly preceding mitosis it follows the successful completion of s phase during s phase synthesis phase is the part of the cell cycle in which dna is replicated occurring between g 1 phase and g 2 phase precise and accurate dna replication is Phase Transitions in Cell Biology:

Phase transitions occur throughout nature The most familiar example is the one that occurs in water ndash the abrupt discontinuous transition from a liquid to a gas or a solid induced by a subtle environmental change Practically magical the ever so slight shift of temperature or pressure can induce an astonishing transition from one entity to another entity that bears little resemblance to the first So convenient a feature is seen throughout t
